

Low Fidelity Prototyping

Tutorial, IHCI 2022

Introduction: Prototyping

It is very essential to design interfaces in a way that is **simple, effective, easy to use and navigate**. Intricate tasks like arrangement of elements, layout of pages, visibility and accessibility of features, etc. require a lot of **experimenting and iterations**.

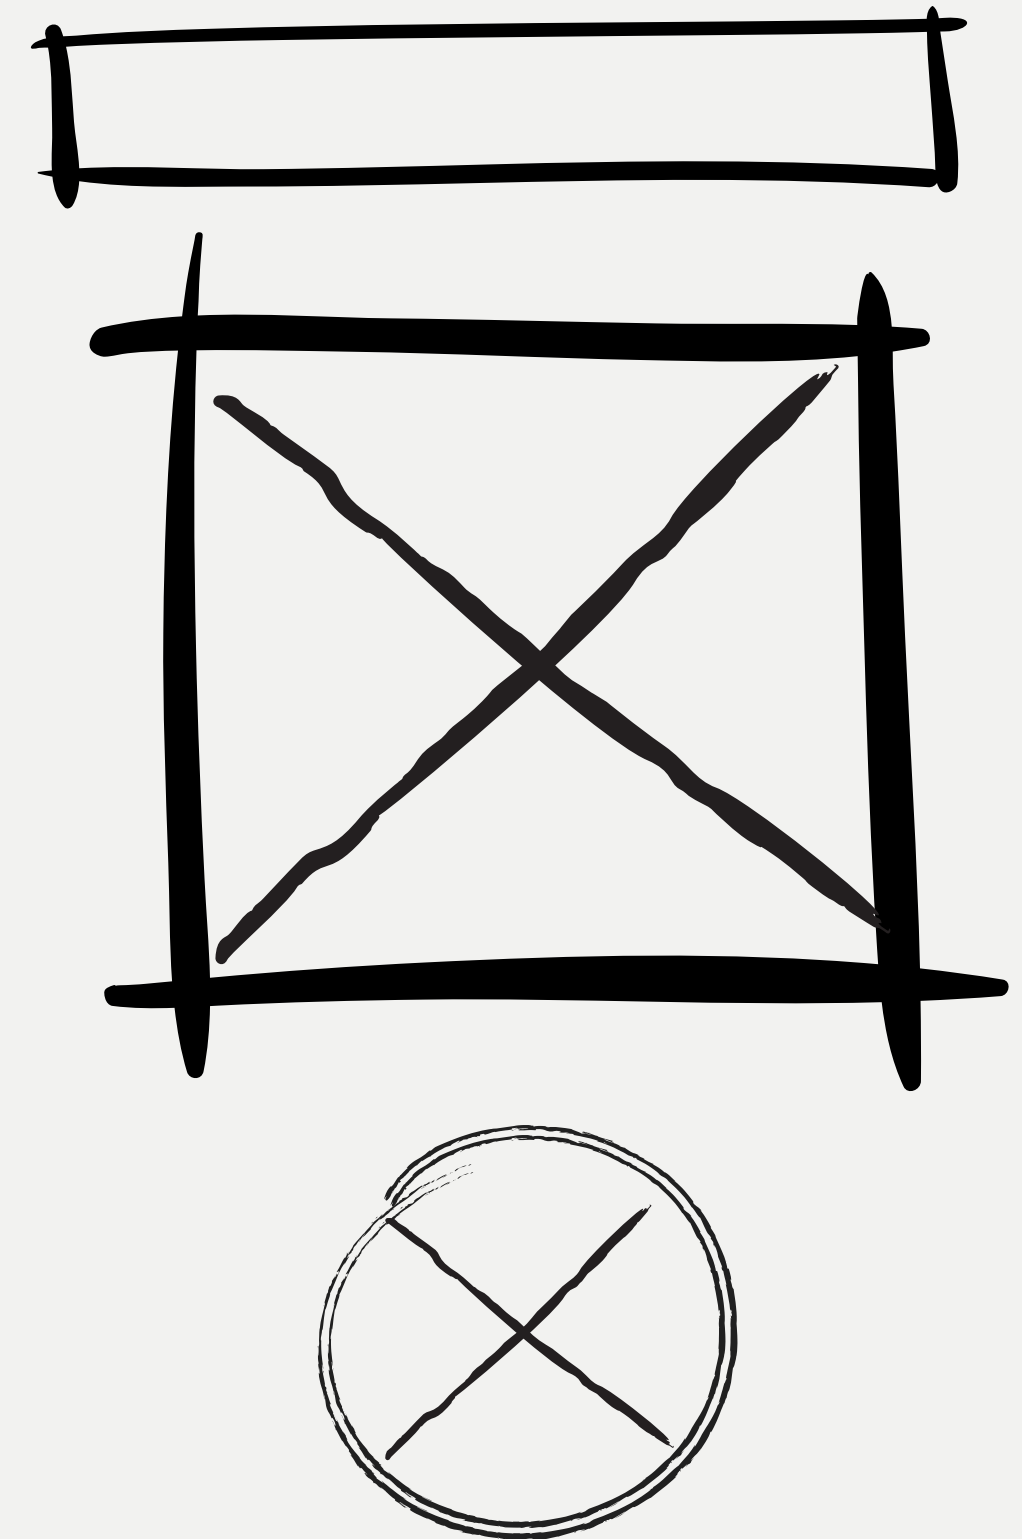

Prototyping, in stages of low–middle–high fidelity, is a framework which gives us the necessary tools and methods to come up with **tangible forms of ideas** that one might have. It allows for **easy visualization**, without the hassle of repeatedly changing the final prototype.

Low Fidelity

It is a part of the **initial stages** of prototyping. It is a quick and easy, tangible representation of a concept, a use flow, or an information structure created for getting quick feedback and improving the product ([Source](#)). Being a very rudimentary stage, it is **implementable within minutes**, and **can be changed very easily**.

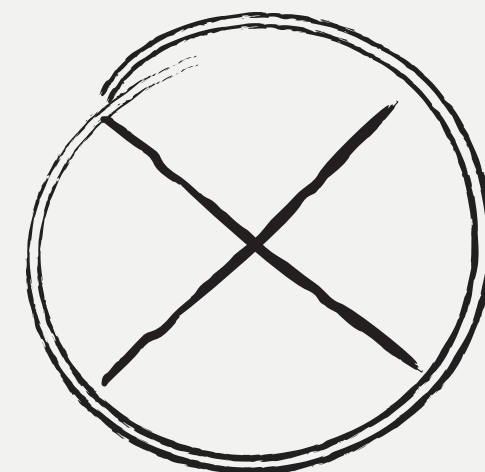

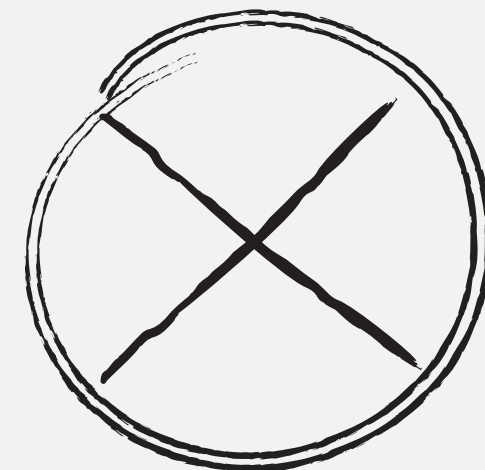

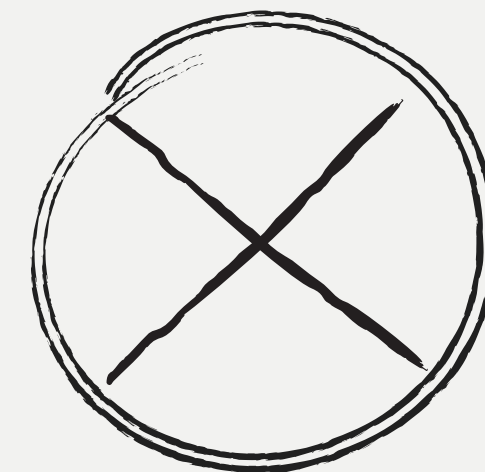

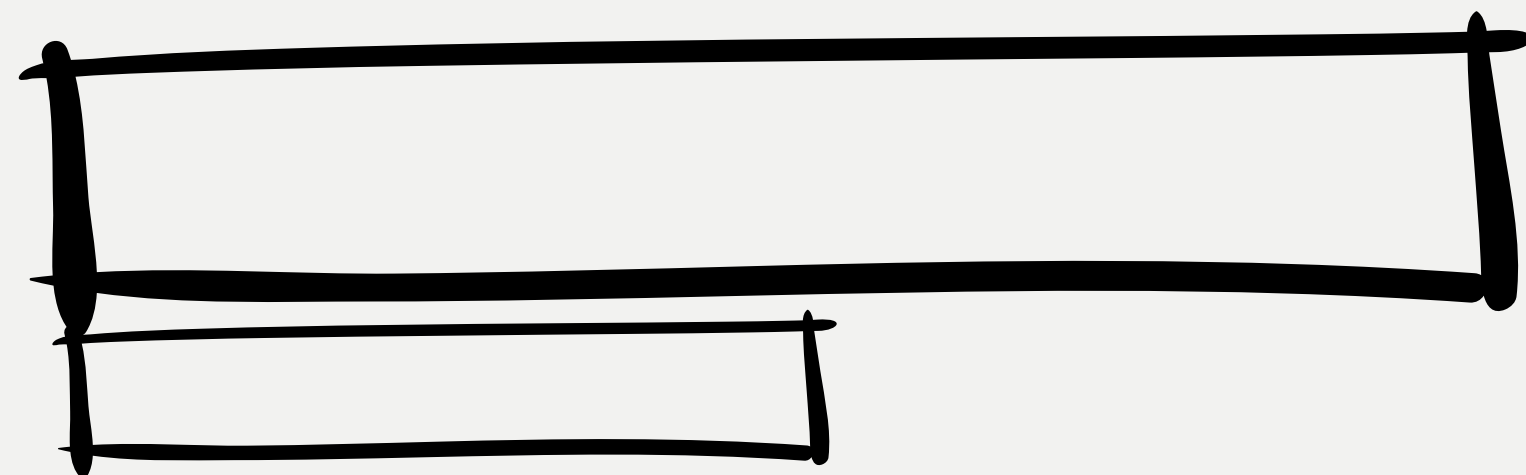

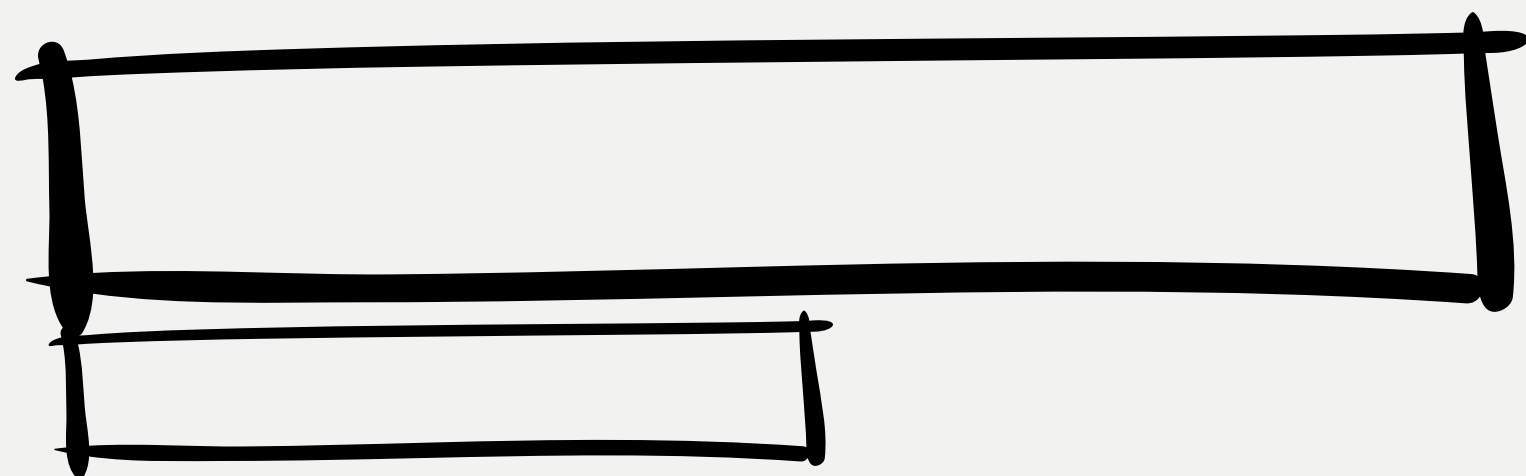

Almost all information is denoted with placeholders, used within wireframes, and gives a very good sense of the **overall layout** of the interface without getting into unnecessary details of what text to place, font, colour scheme, etc.

Why Create a Low Fidelity Prototype?

Steps to Create A Low Fidelity Prototype

Types of Low Fidelity Prototypes

01

Storyboards

02

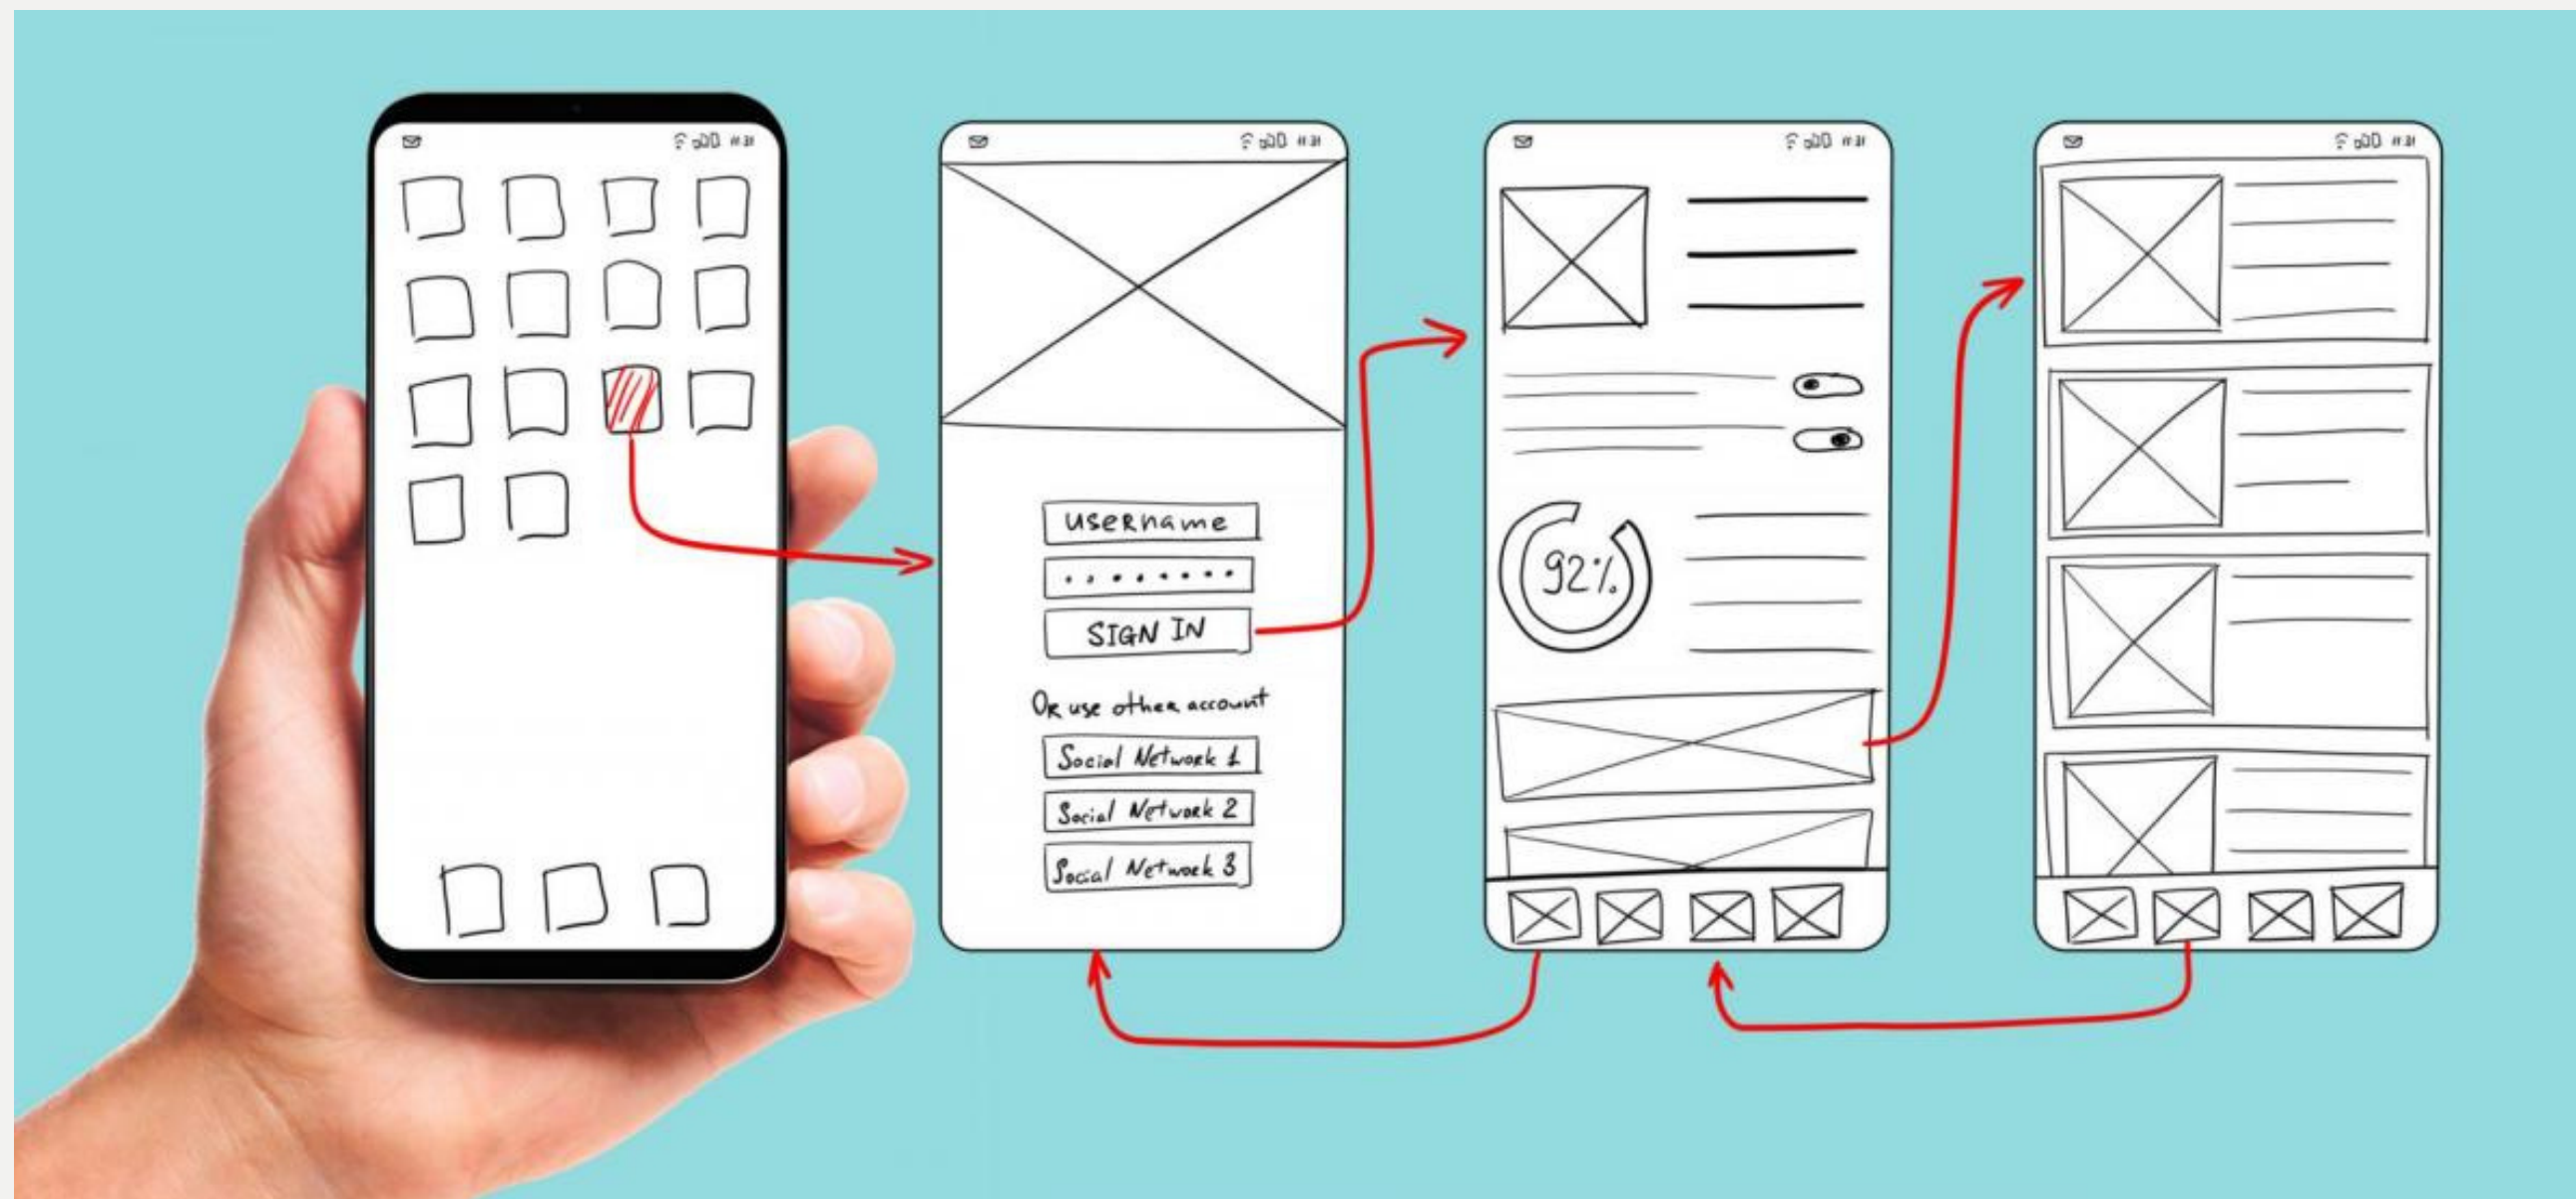

Paper Prototypes

03

Clickable
Presentations /
Wireframes

TYPES OF LOW FIDELITY PROTOTYPES

Storyboards

Hand drawn digital illustrations depicting a user's task flow.

- Static
- No Interaction
- Easy to make
- First step in prototyping

TYPES OF LOW FIDELITY PROTOTYPES

Paper Prototypes

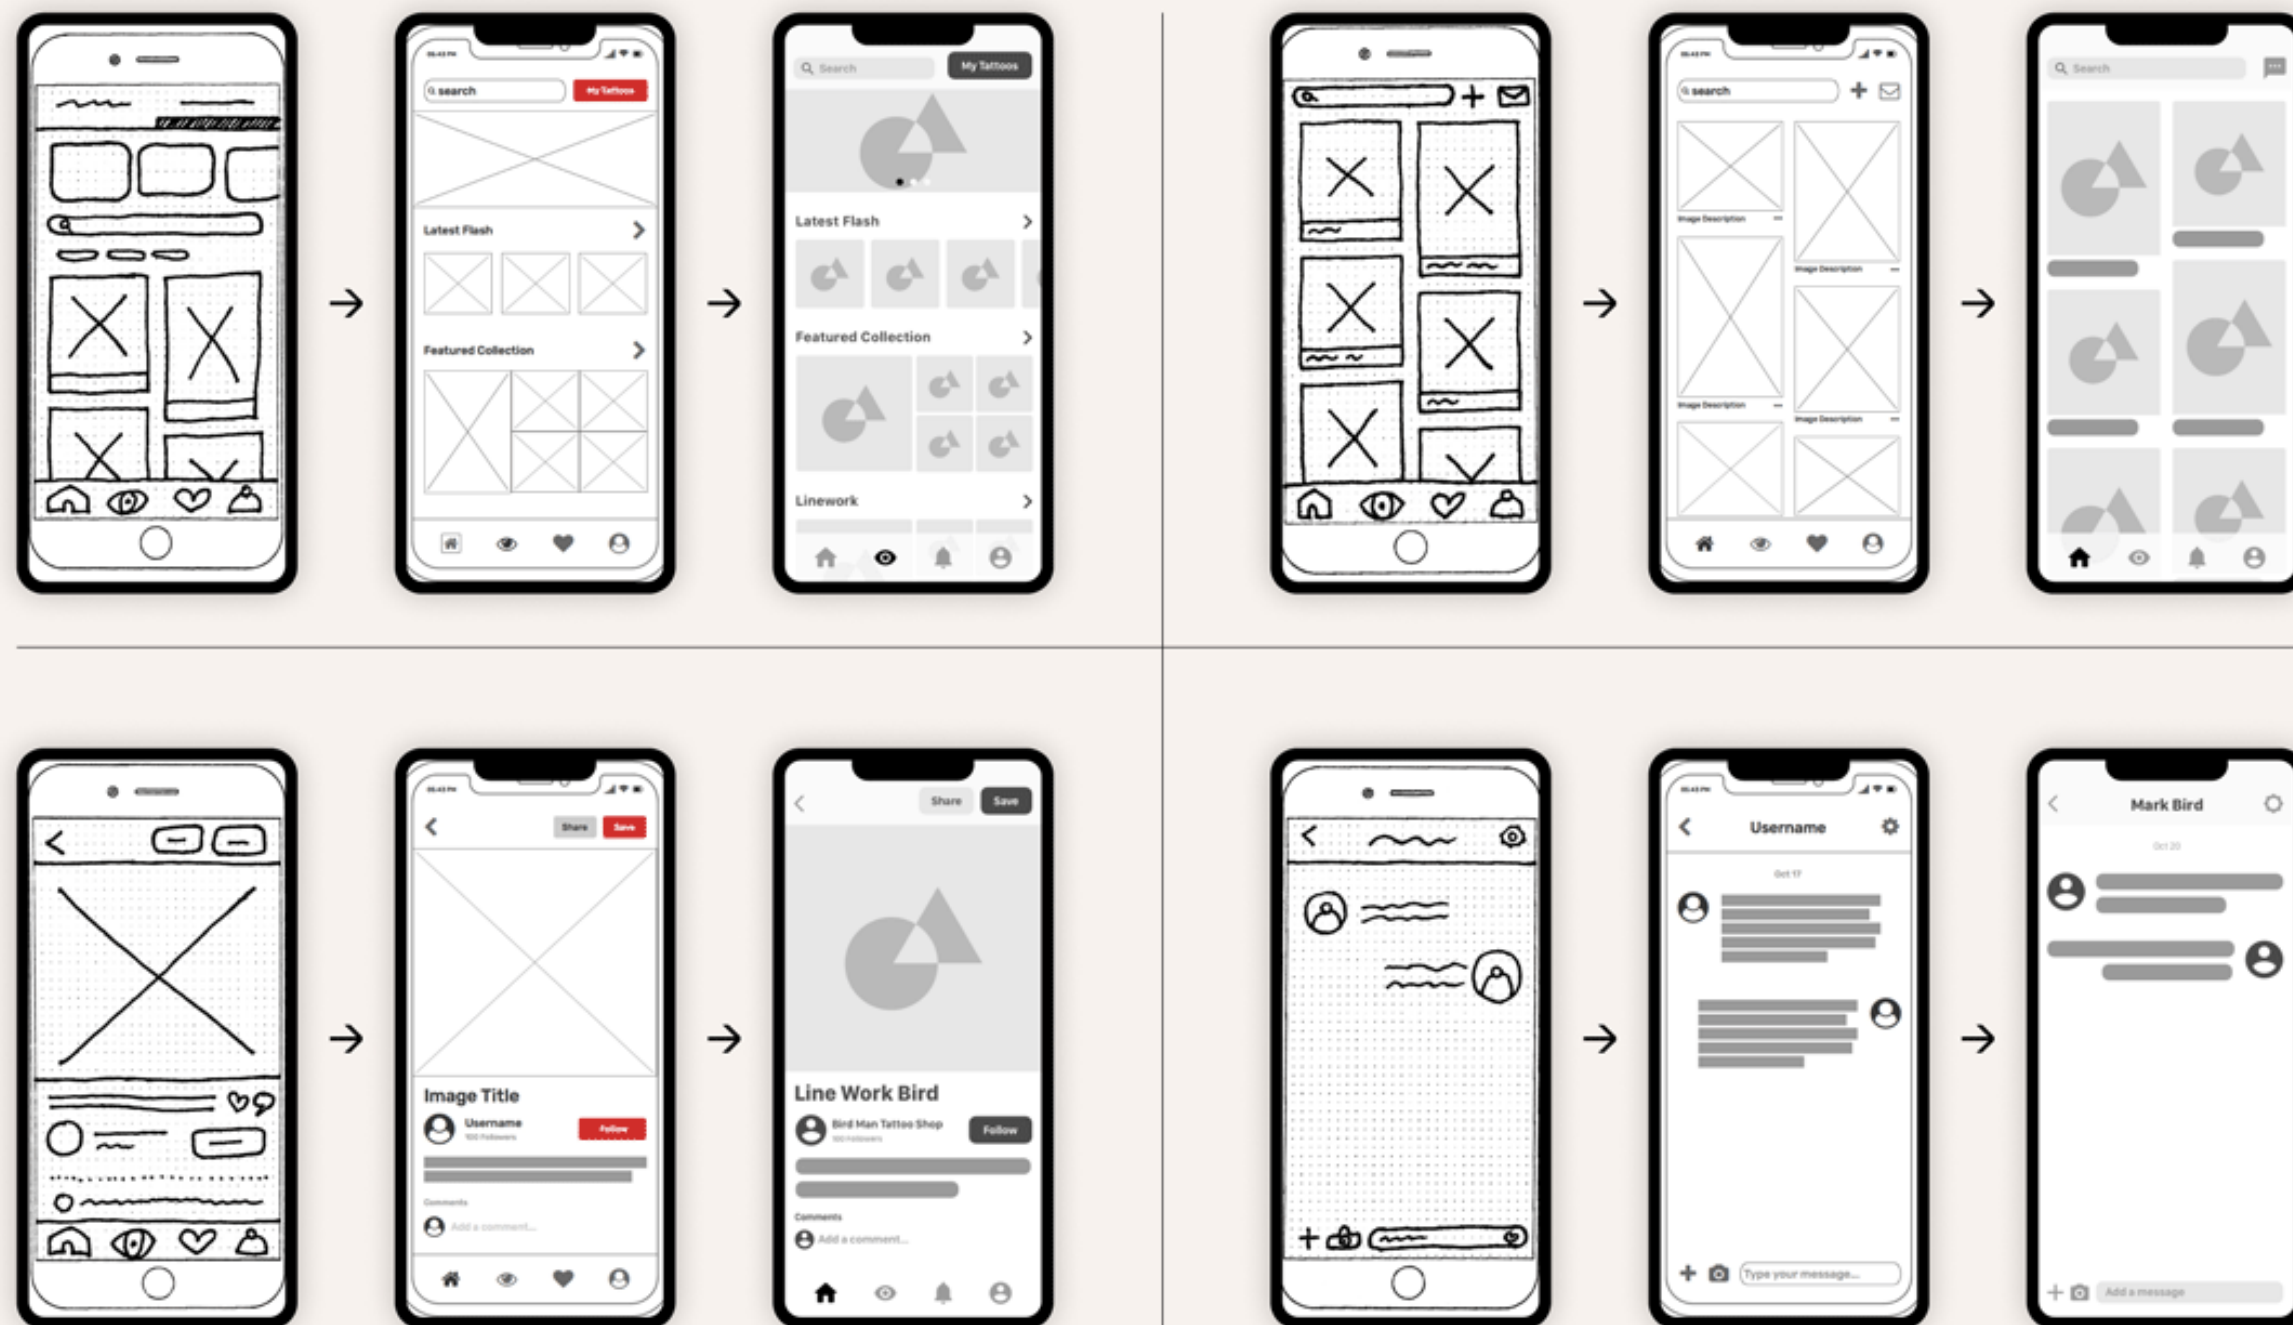

Hand drawn frames on paper depicting a user's task flow.

- Can be physically interacted with
- Hard to make
- Better for physical presentations

TYPES OF LOW FIDELITY PROTOTYPES

Clickable Presentations / Wireframes

Hand drawn digital frames depicting the UI of the expected application.

- Can be animated or made interactive and clickable
- Easy to make
- Best for effective presentation

Tools to Use

01

Online Tools

- Like Figma
- Easy collaboration
- Simple and easy to learn UI
- May have limited interaction options

02

Offline Softwares

- Like Adobe XD
- May not be easy to collaborate
- More complex UI
- Much more options for interactions, transitions, etc

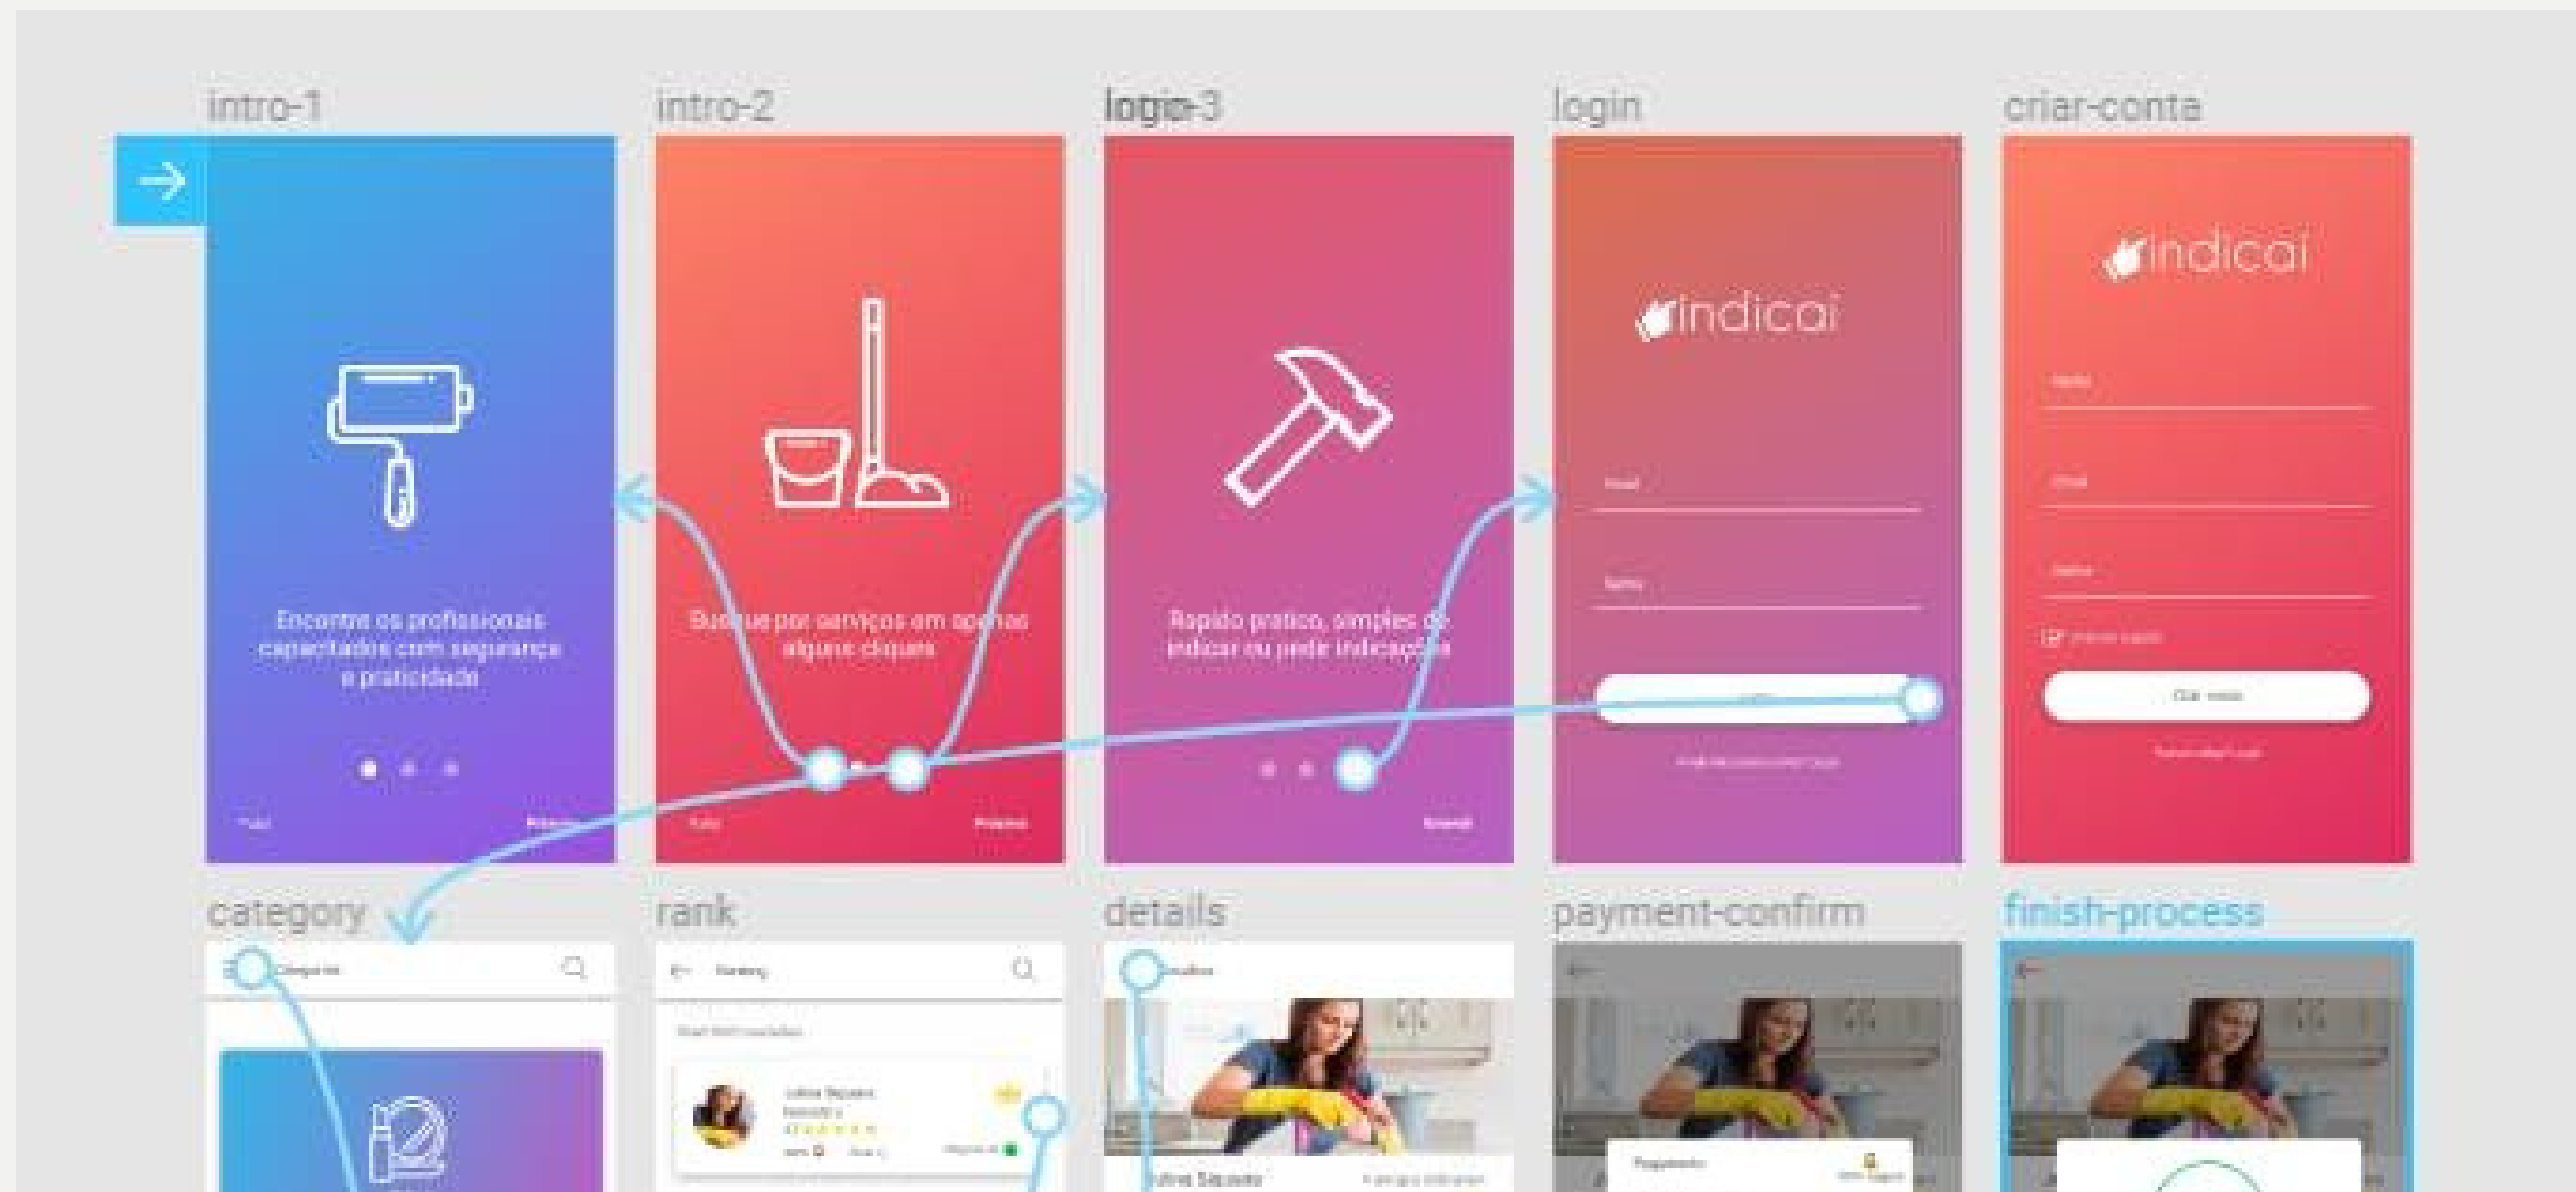

03

Physical Medium

- Like paper drawing
- Can only collaborate physically
- No special skills or learning required
- Limited options for interactivity
