

Tutorial 10

Introduction to Programming

The TAs will recapitulate:

- Modularity
- Abstraction
- Reusability

Then the Class and Object oriented construct would be discussed. Standard definitions and paradigm.

A question based upon the content covered in the lecture (lecture 19) would be done.

After “class” and “OOP” basics, the TAs will proceed with lecture 20 concepts from the slides. They will be discussing:

- Basic data types
- Compound data types
- Data structures → (what and why).

After that, Stack and Binary Trees would be discussed in the class (lecture 20). The problems on postfix expression and inorder traversal should be redone.

This would conclude the tutorial.
